### DETAILED ACTION

#### Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 01/07/2009 has been entered.

## Claim Rejections - 35 USC § 103

- The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Art Unit: 2166

Claims 17-27, and 29-34 are rejected under 35 U.S.C 103(a) as being unpatentable over <u>Kumar et al.</u> (U.S. Patent No. 6,343,287) in view of <u>Keith Schwols</u> (U.S. Patent No. 6,839,721).

As to claim 17, <u>Kumar et al.</u> discloses a method for querying and returning instances of items comprising:

receiving from an application that operates in user space of an operating system (a browser is an application in the user space of an operating system), a request identifying an item (a request is a user commend received from a user application), said item having a scope that includes at least one additional item (Wherein a query such as SQL inherently has a scope, See Abstract, wherein "scope" reads on "what's covered in the database"):

generating, by the database management program that is integrated with the file system (wherein it is inherent that databases are managed at the application level with their own management program), an object that encapsulates an instance of the identified item (See column 16, lines 30-40), the encapsulation providing a method for querying the database management program (See column 14, lines 58-65, wherein "object" includes methods to query the data store, and see column 16, lines 8-30);

executing, by the database management program that is integrated with the file system, a query on said object for at least one additional item, the query utilizing the scope of the identified item as a parameter (See column 16, lines 8-30, wherein "additional item" reads on "one or more items"); and

Art Unit: 2166

returning to the application at least one instance of the at least one additional item that matches the query (See column 5, lines 24-32, and see column 10, lines 5-10, wherein "query" is a "client request").

Kumar et al., teaches the elements of claim 17 as noted above but does not explicitly teaches wherein the operating system includes a database management program that is integrated with a file system and the operating system is configured to store, data in the file system as file streams, and generate, items associated with the file streams in the database management program.

However, Keith Schwols teaches wherein the operating system includes a database management program that is integrated with a file system and the operating system is configured to store, data in the file system as file streams, and generate, items associated with the file streams in the database management program (See column 3, lines 7-13, column 5, lines 26-59 and claim 1).

Therefore, it would have been obvious to a person of ordinary skill in the art at the time the invention was made to modify the teachings of <a href="Kumar et al.">Kumar et al.</a> with <a href="Keith Schwols">Keith Schwols</a> to provide a simple and efficient data protection system which utilizes a database and a secondary storage device and to utilize an already familiar user interface for file management software for the data protection system.

As to claim 18, Kumar et al. discloses comprising:

interfacing with the database management program, each item associated with at least one schema that defines an item's type (See column 18, lines 19-30); and

Art Unit: 2166

generating at least one data class for each item stored in said database, wherein the fields of the item's type map to the fields of the at least one data class (See column 19, lines 1-21).

As to claim 19, <u>Kumar et al.</u> discloses wherein the at least one schema that defines an item's type is received from a third party (See column 17, lines 24-29, and see column 18, 19-30).

As to claim 20, <u>Kumar et al.</u> discloses wherein generating an instance of said identified item further comprises:

generating an instance of the identified item from at least one data class, wherein the generated instance includes methods specific to the data class (See Abstract, and see column 23, lines 1-14).

As to claim 21, <u>Kumar et al.</u> discloses wherein said object utilizes a connection to the database management program to query the database management program and modify the items stored in said database management program (See column 20, lines 40-52).

As to claim 22, <u>Kumar et al.</u> discloses wherein the query further specifies at *least one of* an item's property, an item's extensions, and an item's relationships as a query parameter (See column 21, lines 35-54).

Art Unit: 2166

As to claim 23, Kumar et al. discloses further comprising:

receiving an indication that said application has modified the *at least one* instance of the at least one additional item (See column 6, lines 14-20, and see column 24, lines 41-57).

As to claim 24, <u>Kumar et al.</u> discloses wherein the object utilizes a method for saving changes to save the modifications to the at least one item stored in said database management program integrated with the file system (See column 20, lines 40-41, wherein it is inherent that API access the underlying storage using a program).

As to claim 25, <u>Kumar et al.</u> discloses wherein the scope of said identified item includes a plurality of items stored in a plurality of database management program integrated with a plurality of file systems (See column 16, lines 48-51).

As to claim 26, <u>Kumar et al.</u>, discloses wherein the object establishes a connection with the plurality of database management program integrated with a plurality of file systems to query for the at least one additional item (See column 20, lines 12-32).

As to claim 27, <u>Kumar et al.</u> discloses wherein the object establishes an individual connection with a specific database management program integrated with a plurality of file systems in the plurality of database management program integrated with a plurality of file systems to save changes to a specific item stored in said specific

Art Unit: 2166

database management program integrated with a specific file system (See column 9, lines 22-25, wherein "access" operation can include "write" or "update" which are all changes).

As to claim 29, Kumar et al. discloses further comprising:

maintaining a cache of the at least one instance of the at least one additional item that matches the query, wherein subsequent queries are performed against the cache (See column 22, lines 40-52).

As to claim 30, Kumar et al. discloses further comprising:

receiving an indication that an application has modified the at least one instance of the at least one additional item (See column 13, lines 2-35, wherein "an indication" reads on "notification"; and

utilizing a method to save changes to the at least one instance of the at least one additional item in said cache (See column 22, lines 40-52, all changes are kept in the registry).

As to claim 31, <u>Kumar et al.</u> discloses wherein said identified item is a set of items that includes one of an entire set of items in the database management program, any subset of items in said database management program, and any individual item in said database management program (See column 16, lines 48-51).

Art Unit: 2166

As to claim 32, <u>Kumar et al.</u> discloses wherein the identified is an item of a type folder, the scope of the item of the type folder includes any items that are contained within the item of the type folder (See column 15, lines 31-44, wherein "type folder" reads on "profiles of the same kind stored in a list").

As to claim 33, <u>Kumar et al.</u> discloses wherein each item stored in said database management program includes a relationship to another item stored in said database management program, said relationship defined by a property in an item that is a source of the relationship and a property in an item that is the target of the relationship (See column 22, lines 1-14, wherein "profile" is dedicated to one specific data store type).

As to claim 34, <u>Kumar et al.</u> discloses wherein a query that includes an item's relationships as a parameter returns an instance of any item that is the source a relationship and an instance of any item that is the target of a relationship (See Figures 7A-7D, shows type of relationships within a class or among classes used to return instance of any item).

Claim 28 is rejected under 35 U.S.C. 103(a) as being unpatentable over <u>Kumar</u> et al. (U.S. Patent No. 6,343,287 B1) in view of <u>Keith Schwols</u> (U.S. Patent No. 6,839,721) further in view of Plutowski (U.S. Patent No. 6,473,851)-previously cited.

Art Unit: 2166

As to claim 28, <u>Kumar et al. and Keith Schwols</u> do not teach wherein the object includes a conflict handler method that is configured to detect when multiple applications modify instances of the same item and determine what modifications to save by utilizing a policy.

<u>Plutowski</u> teaches wherein the object includes a conflict handler method that is configured to detect when multiple applications modify instances of the same item and determine what modifications to save by utilizing a policy (See column 20, lines 5-21, teaches database access, and see column 24, lines 35-44, teaches conflict resolution detection).

Therefore, it would have been obvious to a person of ordinary skill in the art at the time the invention was made to modify the teachings of <a href="Kumar et al. and Keith">Kumar et al. and Keith</a>
Schwols with <a href="Plutowski">Plutowski</a> to include wherein the object includes a conflict handler method that is configured to detect when multiple applications modify instances of the same item and determine what modifications to save by utilizing a policy to assure efficient access and persistent data storage in the database (See <a href="Plutowski">Plutowski</a> column 2, lines 35-39).

4. Claims 35, and 36 are rejected under 35 U.S.C. 103(a) as being unpatentable over <u>Kumar et al.</u> (U.S. Patent No. 6,343,287 B1) in view of <u>Keith Schwols</u> (U.S. Patent No. 6,839,721) further in view of <u>C. Liebig et al.</u> A Publish/Subscribe CORBA Persistent State Service Prototype. Middleware 2000: IFIP/ACM International Conference on Distributed Systems Platforms, New York, NY, USA, April 2000. Proceedings (From here on in Liebig et al.).

Art Unit: 2166

As to claim 35, <u>Kumar et al.</u> discloses the claimed invention but does not explicitly teaches receiving a request from an application to track changes to one of an item, an item's extensions, and an item's relationships; registering, the database management program integrated with the file system, said application for a notification service that notifies said application when any changes to one of the item, the item's extensions, and the item's relationships are detected.

<u>Liebiq et al.</u> teaches receiving a request from an application to track changes to one of an item, an item's extensions, and an item's relationships (See page 233, lines 1-3, and see page 242, section 4.1.3);

registering, the database management program integrated with the file system, said application (See page 235, section 2.2, and page 237, lines 1-8, wherein "registering" reads on "publish/subscribe" architecture) for a notification service that notifies said application when any changes to one of the item, the item's extensions, and the item's relationships are detected (See page 238, wherein various types of "notification" are sent to the applications).

Therefore, it would have been obvious to a person of ordinary skill in the art at the time the invention was made to modify the teachings of <a href="Kumar et al. and Keith Schwols">Kumar et al. and Keith Schwols</a> with <a href="Liebig et al.">Liebig et al.</a> to include receiving a request from an application to track changes to one of an item, an item's extensions, and an item's relationships; registering, the database management program integrated with the file system, said application for a notification service that notifies said application when any changes to one of the item, the item's extensions, and the item's relationships are detected because it provides a

Art Unit: 2166

way to efficiently propagate and manage updates in distributed heterogeneous network (See Liebig et al. abstract).

As to claim 36, <u>Kumar et al.</u> as modified discloses wherein said notification service notifies said application when any changes to items associated with the item, the item's extensions, and the item's relationships are detected (See <u>Liebig et al.</u> page 238, wherein various types of "notification" are sent to the applications).

## Response to Arguments

 Applicant's arguments have been considered but are moot in view of the new ground(s) of rejection.

In these arguments applicant relies on the amended claims and not the original ones.

Examiner combined a new reference Keith Schwols (U.S. Patent # 6,839,721) which teaches a database having a file management program.

Claims must be given the broadest reasonable interpretation during examination and limitations appearing in the specification but not recited in the claim are not read into the claim (See M.P.E.P. 2111 [R-I]).

Art Unit: 2166

#### Contact Information

 Any inquiry concerning this communication or earlier communications from the examiner should be directed to USMAAN SAEED whose telephone number is (571)272-4046. The examiner can normally be reached on M-F 8-5.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Hosain Alam can be reached on (571)272-3978. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
